

MDaudit™ Enterprise

The intelligent solution for a risk-based world

MDaudit

A HAYES TECHNOLOGY

MDaudit Enterprise

A single platform for all your compliance and auditing needs

MDaudit Enterprise is a risk intelligent solution that enables compliance and auditing professionals to continuously monitor risk, detect anomalies and automate workflows in a single, secure cloud-based platform. The platform provides all the necessary tools to move to a risk-based management approach.

Changes in the healthcare industry are putting more pressure on oversight responsibilities for both hospitals and physician practices. To avoid financial penalties, reimbursement paybacks and tarnished reputations, organizations need to be able to easily identify risk and outliers, audit for further investigation and initiate corrective action as needed.

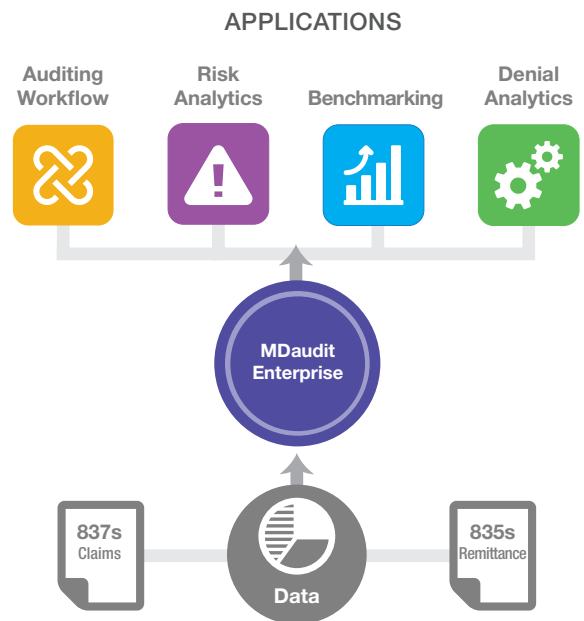

MDaudit Enterprise is designed to provide seamless continuous monitoring, anomaly detection and workflow automation, in one closed-loop platform. It provides you with all the tools you need to move from risk identification to risk management without having to switch between multiple applications.

MDaudit Enterprise:

- Supports root cause analysis with actionable reports to fix underlying causes of error resulting in fewer false positives and improved corrective action
- Provides continuous monitoring of risk areas to uncover risk issues
- Benchmarks performance against peer organizations to enable continuous improvement
- Detects potential costly anomalies for corrective action
- Improves productivity and optimizes limited resources through workflow automation

MDaudit Enterprise allows you to mine your organization's billing and remit data to identify compliance and revenue risks. Our analyzer provides key metrics focused on current risk areas, and allows you to monitor provider billing patterns and benchmark against peers. This in turn helps you prioritize your risk focus; develop corrective action plans and design dashboards that enable ongoing monitoring and provide alerts when issues drift outside the norm of predetermined standards.

Leveraging the expertise of the MDaudit community

MDaudit Enterprise was created by leveraging the best practices from compliance thought leaders at prominent healthcare organizations across the country.

As a member of the MDaudit partner community, you will be able to access and use a growing library of curated, proven risk management and compliance best practices. You can benchmark your performance against real-world data from peer organizations or CMS to better understand your efficacy and identify potential risk areas for further analysis.

Risk management and process improvement

Supports risk-based compliance and revenue management programs

A risk-based approach allows you to increase staff productivity, assess organizational risk and assign resources judiciously. MDaudit Enterprise’s user-customized automated process enables continuous monitoring of billing data and remits allowing your compliance and finance departments to drill down, identify, explore and respond to both risks and outliers. Your revenue cycle team can use the same data to uncover lost revenue opportunities.

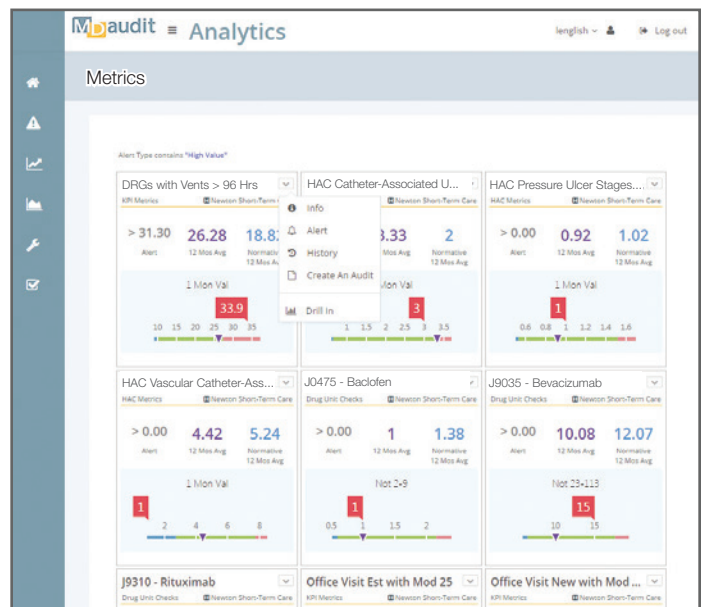

You can analyze issues that pose potential risks by setting up your own case searches. If you identify and correct problems, you can also set up ongoing monitoring to alert you if the data begins to veer out of your established thresholds.

Even if you are shifting to a risk-based model, you will likely want to continue to monitor and review new providers. MDaudit Enterprise makes this easy by setting up new providers as a risk area. The platform recognizes billing from new providers and automatically flows it into a risk area so you can review, audit and educate as needed. MDaudit Enterprise allows you to easily examine each new provider as they begin their relationship with you to establish an upfront, sustainable documentation process.

Focus on process improvement, not just error detection

By gaining true insight into compliance and risk, you are better able to focus your effort on root cause analytics that gets to the heart of the issue. You can then “treat the disease, instead of the symptoms” to correct and eliminate the underlying problems permanently.

Once your ongoing monitoring and trending reviews uncover an area of risk, MDaudit Enterprise enables you to seamlessly add these identified risks to analytics metrics and create audits for further investigation with only a few simple clicks. You can then track these issues from audit through reporting to follow up in a closed-loop process.

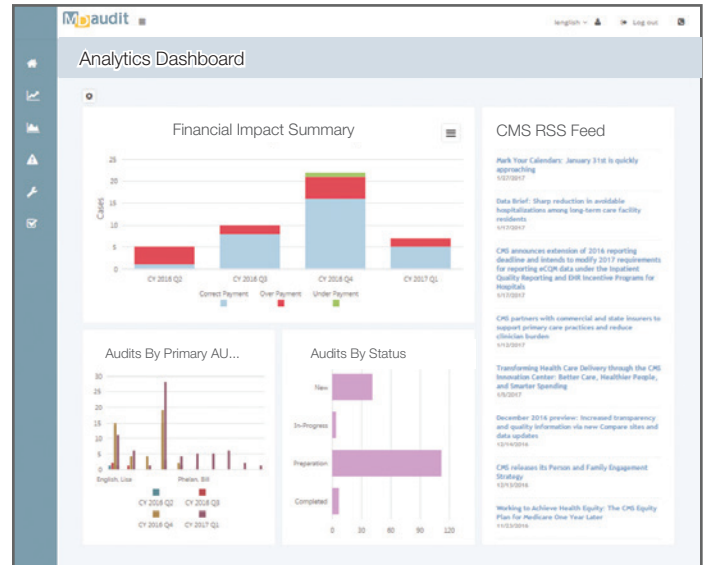

You can drill down into a wide variety of metrics, like “Vents Over 96 hours” and automatically create audits to understand if this is a risk area for your organization.

Customizable dashboards and reports

MDaudit Enterprise allows you to customize your dashboard views so you can access what's important to you. Choose from over 70 pre-installed risk metric areas to populate your dashboard. You can also build your own risk metric and immediately load it to your personalized dashboard. This sift and sort functionality enables you to easily drill down into valuable data to study existing issues or prevent potential ones from occurring.

Choose from a library of pre-built reports or create ad hoc reports to communicate to various audiences including senior leadership, clinicians and compliance peers. As reports are added to the library you can add those you care about to your customized audit package.

MDaudit Enterprise allows you to customize your dashboard so you can view what's important to you.

About Hayes and MDaudit

Hayes is a leading healthcare technology provider that partners with the nation's premier healthcare organizations to improve revenue, mitigate risk and streamline operations to succeed in an evolving healthcare landscape. By combining our industry-leading revenue integrity software, MDaudit Enterprise, with unparalleled compliance and revenue cycle expertise, we help organizations collect, find, recover and retain more revenue dollars throughout the entire revenue stream.
